

Transit Monitoring Services

COTRACK® Customized Solution for your Transit Monitoring

Cotrack® is a tracking solution, developed by Cotecna to reinforce the capacity of Customs to better control transit and efficiently fight against fraud whilst facilitating trade. It is based on state-of-the-art GPS, telecommunications and RFID technologies.

The objective of Cotrack® is to provide Customs with real time evidence of the location of transit trucks or containers and eventual abnormal events that could occur during transit journeys such as door opening and deviation from the authorized route.

Our tracking solution provides the possibility to target risky or suspect operations and thus help Customs to decide on the appropriate intervention measures. They are also used to reduce delays at borders for compliant trade operators and to accelerate the release of the Transit guarantee.

Cotrack® solution incorporates three key components; the mobile unit, installed on the vehicle or container for the duration of the transit trip; fixed tracking units that equip the Customs patrol cars; and our specialized software. Cotrack® is a flexible solution that is tailored to specific Customs requirements and that can also be implemented to address national security threats as well as the delivery of petroleum products.
